

AI-Powered Call Script Trainer

for India-based PACS Support Teams

The Problem

Our India-based PACS support engineers handle inbound calls from US-based radiologists, technologists, and hospital IT staff. Today, new hires ramp up by shadowing seniors and reading SOP documents — there is no safe, repeatable way for them to practice live customer conversations before taking real calls. This results in:

- Slow ramp-up — new engineers take 6–8 weeks before confidently handling Sev-2 PACS issues end-to-end.
- Inconsistent customer experience — tone, troubleshooting order, and use of DICOM/HL7 terminology vary significantly between engineers, especially on hard scenarios like 'modality not sending to PACS' or 'viewer can't load studies.'
- No measurable practice — managers cannot see who has practiced what, where the gaps are, or how an engineer is improving.
- Accent and language confidence — engineers often know the technical answer but struggle with spoken delivery, pacing, clarifying questions, and active listening with US customers.

The Solution

Support Script Trainer is a mobile app that lets engineers role-play real PACS support calls against an AI that plays the US customer. The engineer picks a scenario (e.g. "Radiologist can't log into the PACS viewer"), and the AI customer responds in character, with realistic frustration, follow-up questions, and the specific symptoms a real user would describe.

Trainees can practice in two modes:

- Text mode — type responses, useful for studying scripts and troubleshooting flow.
- Voice mode — speak into the phone like a real call. The AI transcribes the engineer's speech, replies in character, and the customer's response is read back aloud. The result feels like a live phone call.

A built-in quick-reference panel gives engineers instant access to DICOM ports, AE titles, common error codes, and HL7 basics during the call — the same support they'd have on a real desk. At the end of each call, the AI produces structured feedback: what went well, what to improve, and scores on greeting, troubleshooting steps, empathy, and resolution.

Key Capabilities

Capability	Benefit
10+ pre-built scenarios across Easy / Medium / Hard difficulty	Covers the most common real-world PACS issues out of the box.

Custom scenario authoring	Managers can add internal-specific scenarios — e.g. specific customer environments or recent escalations.
Voice role-play (speech-to-text + text-to-speech)	Builds spoken confidence; closer to real-call practice than any script reading.
Reference panel during call	Mirrors the on-desk experience so engineers learn to retrieve info under pressure.
Per-call AI feedback + progress tracking	Objective, measurable practice — managers can see improvement over time.

Business Value

- Cut ramp-up time for new engineers by an estimated 30–40% by replacing passive shadowing with active, repeatable practice.
- Reduce escalations on Sev-2 scenarios by ensuring every engineer has rehearsed the top 10 issue types before taking live calls.
- Standardize the customer experience — every engineer practices the same greeting, troubleshooting order, and closing.
- Always-on practice — engineers can drill scenarios from their phone between shifts, no trainer required.
- Visibility for managers — progress per engineer, per scenario, per difficulty.

Current Status

A working pilot is live as a mobile-friendly web app. It includes the 10 starter scenarios, custom scenario authoring, voice mode, the on-call reference panel, and AI-generated post-call feedback. The conversation and voice are powered by OpenAI's latest models.

Proposed Next Steps

1. Pilot with a 5–8 person new-hire cohort for 2 weeks; compare time-to-first-solo-call against the previous cohort.
2. Add 10 more scenarios sourced from this quarter's real escalations.
3. Ship a native iOS / Android app (currently web) for a more seamless on-phone experience.
4. Build a manager dashboard — per-engineer practice volume, scores, and weakest scenario categories.
5. Optional: plug in anonymized real call recordings to auto-generate new training scenarios.
